## 1 ADDITIONAL IMPLEMENTATION DETAILS

In this section, we give the detailed network structure in Sect. 1.1 and provide a comprehensive numerical analysis of networks in different methods in Sect. 1.2.

### 1.1 Network Structure

As mentioned in the main paper, we have made modifications to the phase generator and phase encoder of HoloNet [1] and CCNNs [5] to accommodate the division of the input image into  $r^2$  sub-image.

For HoloNet with our method, we just modify the input and output channels of the first and last convolution layers in both the phase generator and phase encoder. The other parts remain consistent with HoloNet, and the specific modifications are listed in Table 1 and Table 2. Thanks to the pixel-unshuffle layer, the resolution of the input images to sub-networks in our frameworks is smaller than the resolution of the input images to sub-networks in the baseline HoloNet. Therefore, the hologram generation rate of our frameworks is faster than that of the naïve HoloNet, as shown in Table 1 in the main paper.

Similar modifications are also made in CCNNs. Specifically, we not only modify the input and output channels but also further adjust the number of convolutional layers to maintain maximum channel number consistent with the baseline CCNNs. The specific results are shown in Table 3 and Table 4.

Furthermore, we provide the detailed structure of the proposed lightweight super-resolution (SR) network in Table 5. Finally, to demonstrate that our method, like other divide- and-conquer algorithms, can be implemented in a recursive form, we design a pyramid framework to synthesize large-scale high-quality holograms to illustrate this point, as shown in Fig. 2.

### 1.2 Numerical analysis

To provide a more comprehensive comparison of the proposed frameworks and the baseline frameworks in terms of computational complexity, we further analyze the network parameters and floating-point operations per second (FLOPs) of various methods. The quantitative results are shown in Table 6 and Table 7. It can be clearly observed that, in contrast to previous methods [3, 5], our proposed divide-and-conquer strategy does not reduce, and in some cases even increases, the network parameters to ensure the generation of high-quality holograms. Furthermore, during the divide-and-conquer stage, our method also accelerates the generation of holograms.

## 2 ADDITIONAL SIMULATION RESULTS

In this section, we provide more visual results of the 8K holograms and reconstructed images in Fig. 2. To the best of our knowledge, it

is the first demonstration of 8K hologram generation and reconstruction on single consumer-grade GPU.

Table 6: **The overall network parameters and Floating Point Operations (Flops) for HoloNet and HoloNet w/ ours.** “Params” represents the overall parameters of the network.

Methods	HoloNet			
	1080p		4K	
	Params (M)	Flops (G)	Params (M)	Flops (G)
w/o	2.87	333	Out-of-memory	
w/ $\times 2$	3.01	158	2.91	425
w/ $\times 4$	3.11	53	2.96	132
w/ pyramid	3.17	170	2.97	261

Table 7: **The overall network parameters and Floating Point Operations (Flops) for CCNNs and CCNNs w/ ours.** “Params” represents the overall parameters of the network.

Methods	CCNNs			
	4K		8K	
	Params (K)	Flops (G)	Params (K)	Flops (G)
w/o	42.3	29	42.3	117
w/ $\times 4$	112.7	71	112.7	284
